Interence for randomized experiments.

The Average Treatment Effect CATE). [also Army Cansal Effect CACE)?

$$Z = \frac{1}{N} \sum_{i=1}^{N} (Y_i(u) - Y_i(u))$$

This is a fixed quantity. ble the potential outcomes an fixed.

This is unidentifiable, can only estimate it.

Estimator for E! The Negman estimator / difference -in-many.

$$\frac{2}{\pi} : Z \xrightarrow{1} \sum_{i,j \in S} \sum_{i,j \in S}$$

Properties.

①
$$\mathbb{E}[\hat{\tau}] = \tau$$
.
② $Var(\hat{\tau}) \leq \frac{S^2}{n_1} + \frac{S^2}{n_2}$ where.

for $k = 0, 1$, $S^2 = \frac{1}{n_1} \cdot \frac{S^2}{n_2} = \frac{1}{n_2} \cdot \frac{S^2}{n_1} = \frac{1}{n_2} \cdot \frac{S^2}{n_2} = \frac{$

Neyman's weak null Hon: ATE = O.

Fisher's strong and Hop! ITE; = 1;(1)-1;(6)=0 4;

To test How, consider the test statistic

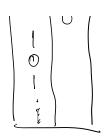

Get appropriately valid, conservative firsten by comparing a squinot NCO, 1).

To test HOR, observe that if Hop is true, we know all the entries in the Science Table. Hence, we can use parametation test.

Fisher's exact test.
